Category:Malware Category:In-jokes Category:Lab computer programsQ: java does not terminate after a while loop I have a problem with my code, after a while loop, is not stopping (couldn't find any solution on the internet). This is my code: public static void main(String[] args) { Scanner sc = new Scanner(System.in); boolean continue = true; while (continue) { System.out.println("Input a number: "); double nr = sc.nextDouble(); double maxNr = Math.max(nr); System.out.println("maxNr is " + maxNr); } sc.close(); } It won't stop after the while loop. Thank you very much for your time and help, Linas A: First, your code doesn't make any sense. You are calling Math.max() on a double but you've also told the scanner to return doubles from nextDouble(), so it will return doubles instead of the value you want. I think what you really wanted to do was to keep asking for input until the user enters a value that's larger than the max value. You'd get better behavior if you used sc.nextInt() and then cast the int to a double using the double constructor, and did a comparison instead of using Math.max(). Example: Scanner sc = new Scanner(System.in); while (true) { System.out.println("Input a number: "); double nr = sc.nextDouble(); if (nr > Double.MAX\_VALUE) { System.out

Mitochondria are the main site of cellular energy production and contain a lipophilic ubiquinone-10, which functions as a crucial electron carrier during mitochondrial oxidative phosphorylation (OXPHOS). We recently found that the ratio of KSM-1 peptides, produced from the amino acid sequence of the precursor protein of the ubiquinone-10 biosynthetic enzyme Q9 unit, with the length of 30 amino acid residues increased in brain tissue from patients with Krabbe disease, compared with that from patients with Tay-Sachs disease. Here, we further studied whether mitochondrial functions in normal lymphocytes are affected by KSM-1 peptides from patients with Krabbe disease or Tay-Sachs disease. We found that the addition of KSM-1 peptides from patients with Krabbe disease in culture medium did not affect cell viability or the cell growth in normal human lymphocytes, but significantly decreased basal OXPHOS, complex I-III and complex IV activities in mitochondria isolated from normal human lymphocytes and lymphoblastoid cell line. KSM-1 peptides (500 ng/ml) from patients with Tay-Sachs disease, however, had no apparent effect on any of the mitochondrial functions. These results show that the decreased level of the Ubiquinone-10 by KSM-1 peptides from patients with Krabbe disease leads to the inhibition of OXPHOS in mitochondria from normal human lymphocytes. 279 S.E.2d 293 (1981) Margaret SPURLOCK, Employee v. SOUTH CAROLINA ELECTRIC AND GAS COMPANY, Employer, and Mid-State Automotive, Inc., Carrier. No. 8016SC372. Court of Appeals of North Carolina.
